Distributed control systems (DCSs) are computer-software packages communicating with control hardware and providing a centralized human-machine interface (HMI) for controlled equipment. 1 Programmable logic controllers (PLCs) form the core of DCSs and other computer control systems. These replace hard-wired relay circuits and allow easy programming and reprogramming; easy diagnostics and repair; and communicating with central data collection systems feeding a DCS.

In this paper we focus on systems where needed credentials are distributed among different components, if they exist at all, and may be created at distant components reactively and with human intervention. Such systems give rise to new requirements for credential-creation and proof-construction algorithms.

70. Practical Distributed Control Systems (DCS)

A distributed control system (DCS) is used to control production systems within the same geographic location. It usually involves a computer that communicates with control elements distributed throughout the plant or process, e.g. machine or process controllers and PLCs, through a bus or directly and displays gathered data.
