The Physiology Of The Joints

The joint with the greatest range of motion is the ball-and-socket joint. At these joints, the rounded head of one bone (the ball) fits into the concave articulation (the socket) of the adjacent bone (see Figure 3f). The hip joint and the

Of The Joints
The glenohumeral
(shoulder) joint are
the only ball-and-
socket joints of the
body.

9.4 Synovial Joints –
Anatomy and
Physiology
They are highly
moveable and all
have a synovial
capsule (collagenous
structure)

File Type PDF The Physiology

Of The Joints
Upper Limb
Volume

surrounding the entire joint, a synovial membrane (the inner layer of the capsule) which secretes synovial fluid (a lubricating liquid) and cartilage known as hyaline cartilage which pads the ends of the articulating bones. There are 6 types of synovial joints which

File Type PDF The Physiology

Of The Joints
are classified by the
shape of the joint and
the movement
available.

Types Of Joints -
Synovial,
Cartilaginous, Fibrous
explained
Where two bones
meet, called the joint,
the bone ends are
covered with
cartilage, also known

File Type PDF The Physiology

of the Joints
as gristle. This

cartilage is sturdy,
elastic and spongy or
compressible, and
keeps the bones from
moving against each
other at the joint. The
cells of this cartilage,
called chondrocytes,
are thought to be the
longest living cells of
the body.
